

Basic Programming assignment 13

1. Write a program that calculates and prints the value according to the given formula:

$Q = \text{Square root of } [(2 \cdot C \cdot D)/H]$

Following are the fixed values of C and H:

C is 50. H is 30.

D is the variable whose values should be input to your program in a comma-separated sequence.

Example: Let us assume the following comma separated input sequence is given to the program: 100,150,180

The output of the program should be: 18,22,24

```
In [1]: from math import sqrt
def calculateProgram():
    in_num = eval(input("Enter the Input: "))
    out_num = []
    C = 50 # Declaring and initializing constant C
    H = 30 # Declaring and initializing constant H
    for ele in in_num:
        Q = str(int(sqrt((2*C*ele)/H)))
        out_num.append(Q)
    print("Output: {}".format(','.join(out_num)))

calculateProgram()
```

Enter the Input: 100,150,148,158

Output: 18,22,22,22

2. Write a program which takes 2 digits, X,Y as input and generates a 2-dimensional array. The element value in the i-th row and j-th column of the array should be $i*j$.

Note: $i=0,1\dots, X-1$; $j=0,1,iY-1$.

Example: Suppose the following inputs are given to the program: 3,5 Then, the output of the program should be: [[0, 0, 0, 0, 0], [0, 1, 2, 3, 4], [0, 2, 4, 6, 8]]

```
In [2]: import array as arr
def generateArray():
    in_x = int(input('Enter the No of Rows:'))
    in_y = int(input('Enter the No of Columns:'))
    out_array = []
    for ele in range(in_x):
        out_array.insert(in_x,[])
        for sub_ele in range(in_y):
            out_array[ele].append(ele*sub_ele)
    print(out_array)

generateArray()
```

Enter the No of Rows:3

Enter the No of Columns:5

[[0, 0, 0, 0, 0], [0, 1, 2, 3, 4], [0, 2, 4, 6, 8]]

3. Write a program that accepts a comma separated sequence of words as input and prints the words in a comma-separated sequence after sorting them alphabetically ?

Suppose the following input is supplied to the program: without,hello,bag,world

Then, the output should be: bag,hello,without,world

```
In [3]: def sortString():
    in_string = input("Enter the Input String: ")
    out_string = ','.join(sorted(in_string.split(',')))
    print(f'Output: {out_string}')

sortString()
```

Enter the Input String: without,hello,bag,world

Output: bag,hello,without,world

4. Write a program that accepts a sequence of whitespace separated words as input and prints the words after removing all duplicate words and sorting them

alphanumerically.

Suppose the following input is supplied to the program: hello world and practice makes perfect and hello world again
Then, the output should be: again and hello makes perfect practice world

```
In [4]: def sortAlphaNumerically():
        in_string = input("Enter the Input String: ")
        out_string = ' '.join(sorted(sorted(list(set(in_string.split(" "))))))
        print(f'Output: {out_string}')

        sortAlphaNumerically()
```

Enter the Input String: hello world and practice makes perfect and hello world again
Output: again and hello makes perfect practice world

5. Write a program that accepts a sentence and calculate the number of letters and digits.

Suppose the following input is supplied to the program: hello world! 123

Then, the output should be:

LETTERS 10 DIGITS 3

```
In [5]: def countLetterAndDigits():
        in_string = input("Enter the Input String: ")
        lettersList = 'ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz'
        digitsList = '0123456789'
        letters = 0
        digits = 0
        for ele in in_string:
            if ele in lettersList:
                letters += 1
            if ele in digitsList:
                digits += 1
        print(f'LETTERS {letters} \nDIGITS {digits}')

        countLetterAndDigits()
```

Enter the Input String: hello world! 123
LETTERS 10
DIGITS 3

6. A website requires the users to input username and password to register. Write a program to check the validity of password input by users.

Following are the criteria for checking the password:

At least 1 letter between [a-z]

At least 1 number between [0-9]

At least 1 letter between [A-Z]

At least 1 character from [!@#]

Minimum length of transaction password: 6

Maximum length of transaction password: 12

Your program should accept a sequence of comma separated passwords and will check them according to the above criteria. Passwords that match the criteria are to be printed, each separated by a comma.

Example:

If the following passwords are given as input to the program: ABd1234@1,a F1#,2w3E*,2We3345 Then, the output of the program should be: ABd1234@1

```
In [6]: def checkPassword():
        in_string = input("Enter the Input String: ")
        small_list = "abcdefghijklmnopqrstuvwxyz"
        cap_list = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
        num_list = "0123456789"
        special_list = "!@#"
        for ele in in_string.split(","):
            if len(ele) <= 12 and len(ele) >= 6 :
                if any(i.isupper() for i in ele):
                    if any(i.islower() for i in ele):
                        if any(i for i in ele if i in special_list):
                            print(ele)

        checkPassword()
```

Enter the Input String: ABd1234@1,a
ABd1234@1
